- Measuring range up to 50 m on diffuse reflecting surfaces, up to 150 m with reflector plate
- Option with integral heating
- Easy alignment with laser sighting
- Precise measurement on various surfaces
- User-friendly sensor installation
- Accessories and special models available

optoNCDT ILR118x-30 sensors are robust, optoelectronic sensors for non-contact distance measurements for industrial applications. Both sensors operate according to the phase comparison principle, whereby higher precision can be achieved. They can be easily aligned and positioned with a visible laser beam.

The optoNCDT ILR 1182 series operates with a 50 Hz measuring rate and is therefore suitable for fast processes. The mounting grooves on the housing offer flexible mounting options for many situations.

Free setup and configuration software

The scope of supply includes software for easy sensor configuration. The settings can be implemented conveniently via a Windows user interface on the PC. The sensor parameters are transmitted to the sensor via the serial port and can also be saved if required. The software also contains a module which can display and store the measurement results. The sensor is connected to the PC via the sensor cable using a USB converter.

Applications

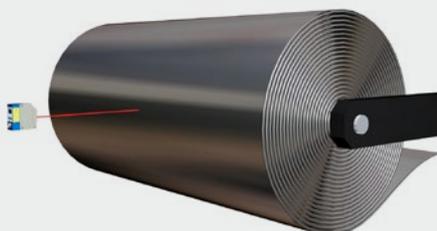

Position measurement on gantry cranes
Gantry cranes require multiple measurement tasks: Positioning of the trolley, detection and dimensioning of containers and monitoring of the minimum clearance between the cranes. The ILR1191 with a very large measuring range and low response time is designed for these measurement tasks.

Crash test speed measurement
At acceleration of cars during crash tests, an ILR1191 measures the impact speed and deformation of the test vehicle.

Filling level measurement in silos
Depending on the required accuracy, laser distance sensors determine the filling level of silos at up to four points. Based on these distances, the filling level is calculated.

Acquisition of coil diameters
The quantity of steel wound on and off is monitored via the acquisition of coil diameters using laser probes.
